Deliverable 3- Short Note:

What the Burndown Chart Tells You That the Board Does Not

A Jira board shows the current status of work items, such as which stories are in To Do, In Progress, Blocked, or Done. However, it does not clearly show whether the team is progressing at the expected rate. A burndown chart provides additional insights that help monitor sprint health and predict outcomes.

1. Progress Trends Over Time

A burndown chart shows how work is being completed throughout the sprint. By comparing daily progress against the ideal burndown line, the team can identify whether work is being completed steadily or accumulating toward the end of the sprint.

2. Remaining Work Visibility

The chart displays the amount of work remaining in the sprint, usually measured in story points. This allows the team to understand how much effort is still required to achieve the sprint goal.

3. Schedule Risk Detection

When the actual burndown line remains above the ideal line, it indicates the team is behind schedule. This early warning helps the PM and team take corrective action before the sprint ends.

4. Velocity Tracking

A burndown chart helps measure how quickly the team is completing work. Consistent progress indicates stable velocity, while sudden drops or flat sections may indicate blockers, scope changes, or productivity issues.

5. Forecasting Sprint Completion

By analyzing the trend of the actual burndown line, teams can estimate whether all planned work is likely to be completed by the sprint deadline. This helps manage stakeholder expectations and plan future sprints more accurately.

6. Difference Between Board View and Burndown View

Jira Board

Shows current status of individual stories and tasks.

Displays where work is located in the workflow.

Helps manage daily execution.

Does not indicate whether the team is ahead or behind schedule.

Burndown Chart

Shows overall sprint progress over time.

Displays how much work remains.

Helps monitor sprint health and schedule risk.

Clearly indicates whether progress is on track, ahead, or behind.

Conclusion

The Jira board provides a snapshot of the current state of work, while the burndown chart provides a trend view of sprint progress. Together, they help teams monitor execution, identify risks, and improve sprint predictability.
