☐

🟢

 Prepare project documentation structure documentation

#5 · rudraksh11 opened 5 minutes ago · Sprint 1

☐

🟢

 Fix formatting inconsistencies in project documents bug

#4 · rudraksh11 opened 6 minutes ago · Sprint 1

☐

🟢

 Define user registration feature feature

#3 · rudraksh11 opened 6 minutes ago · Sprint 1

☐

🟢

 Review business requirements document documentation

#2 · rudraksh11 opened 7 minutes ago · Sprint 1

☐

🟢

 Create project requirements document documentation

#1 · rudraksh11 opened 7 minutes ago · Sprint 1

DELIVERABLE 4:

How a Product Manager Uses GitHub Differently from a Developer

A Product Manager (PM) and a Developer use GitHub for different purposes. A developer primarily uses GitHub to write, review, test, and maintain code. Developers create branches, make commits, submit pull requests, fix bugs, and merge code changes into the main project.

A Product Manager, on the other hand, uses GitHub mainly for planning, tracking, and communication. PMs create and manage issues, define feature requirements, organize work using milestones, monitor project progress, prioritize tasks, and collaborate with stakeholders and developers. Instead of focusing on code implementation, they focus on ensuring that the right features are delivered according to business and user requirements.

For example, a developer may create a pull request to implement a user registration feature, while a Product Manager would create the issue describing the feature, define acceptance criteria, assign priorities, and track its progress until completion. Thus, GitHub serves as a development platform for developers and a project management and collaboration tool for Product Managers.
